ABSTRACT:

The application of spray agglomeration (e.g., spray drying agglomeration, spray congealing agglomeration) using a spray-dryer to drug formulations have been studied. In case of spray drying agglomeration, good results were obtained in regard to granulation process, coating process and compressibility, but taste-masking of a drug with bitter taste was imperfect. Spray congealing agglomeration was preferable on taste-masking and control release properties, but immediate release formulation could not be obtained. Based on the above-mentioned results, pediatric formulation for clarithromycin (CAM), a new macrolide antibiotic with a bitter taste, have been developed. The fundamental objective was to prevent the prepn. from dissolving in the mouth, while ensuring that rapid release of CAM from the prepn. could be attained in the gastrointestinal tract, resulting in bioequivalence to the conventional dosage form. By selecting glyceryl monostearate and aminoalkyl methacrylate copolymer E as ingredients, the optimum formula for the prepn. could be obtained.

SUPPL. TERM: pharmaceutical spray drying taste masking
clarithromycin
INDEX TERM: Taste
(-masking; particle design using spray-dryer)
INDEX TERM: Pharmaceutical dosage forms
(particle design using spray-dryer)
INDEX TERM: Drying
(spray, particle design using spray-dryer)
INDEX TERM: 24938-16-7, Eudragit e 31566-31-1, Glyceryl
monostearate 81103-11-9, Clarithromycin
ROLE: THU (Therapeutic use); BIOL (Biological study);
USES (Uses)
(particle design using spray-dryer)
